

Step 1: Create a lambda function on AWS.

The screenshot shows the AWS Lambda 'Create function' console. At the top, there's a navigation bar with the AWS logo, 'Services' link, a search bar, and user information. The main heading is 'Create function' with an 'Info' link. Below it, a message says 'Choose one of the following options to create your function.' There are three radio button options: 'Author from scratch' (selected), 'Use a blueprint', and 'Container image'. The 'Basic information' section contains a 'Function name' field with 'Pranav-lambda-function' entered, a 'Runtime' dropdown set to 'Node.js 20.x', and an 'Architecture' dropdown set to 'x86_64'. A 'Permissions' section is partially visible at the bottom.

Step 2: There are blueprints mentioned while creating a lambda function choose hello world blueprint.

The screenshot shows the AWS Lambda console for the 'Pranav-lambda-function'. A green notification banner at the top says 'Successfully updated the function Pranav-lambda-function.' The 'Code source' tab is active, showing a code editor with a JavaScript function. The code is as follows:

```
1 export const handler = async (event) => {
2   // TODO: Implement
3   const response = {
4     statusCode: 200,
5     body: JSON.stringify('Hello from Pranav!'),
6   };
7   return response;
8 };
9
```

The interface includes a file explorer on the left showing 'index.mjs', a toolbar with 'Test' and 'Deploy' buttons, and a status bar indicating 'Changes not deployed'.

Step 3: Then deploy the function and click on test to test the function. You need to create the test function, ensure the event is in proper json format.

Configure test event

A test event is a JSON object that mocks the structure of requests emitted by AWS services to invoke a Lambda function. Use it to see the function's invocation result.

To invoke your function without saving an event, configure the JSON event, then choose Test.

Test event action

Create new event

Edit saved event

Event name

first-test

Maximum of 25 characters consisting of letters, numbers, dots, hyphens and underscores.

Event sharing settings

Private

This event is only available in the Lambda console and to the event creator. You can configure a total of 10. [Learn more](#)

Shareable

This event is available to IAM users within the same account who have permissions to access and use shareable events. [Learn more](#)

Template - optional

Event JSON

Format JSON

```
1 {
2   "key1": "value1",
3   "key2": "value2",
4   "key3": "value3"
5 }
```

Edit basic settings

Basic settings info

Description - optional

This is the test lambda function for deployment

Memory info

Your function is allocated CPU proportional to the memory configured.

128 MB

Set memory to between 128 MB and 10240 MB

Ephemeral storage info

You can configure up to 10 GB of ephemeral storage (/tmp) for your function. [View pricing](#)

512 MB

Set ephemeral storage (/tmp) to between 512 MB and 10240 MB.

SnapStart info

Reduce startup time by having Lambda cache a snapshot of your function after the function has initialized. To evaluate whether your function code is resilient to snapshot operations, review the [SnapStart compatibility considerations](#)

None

Supported runtimes: Java 11, Java 17, Java 21.
